## **Authorship**

This report was authored by Dr Kelly Fleming (BSc Hons, PhD - Archaeology), Principal Heritage Officer, Department of Planning Lands & Heritage (State Heritage).

#### Personnel

In addition to Dr Fleming the following State Heritage staff assisted with the recovery and recording:

Daniel Holland (BSc- Archaeology/Environmental Science)

Karina Williams (BA Hons - Archaeology)

## Acknowledgements

State Heritage would also like to acknowledge the assistance of the following staff from the Fremantle Prison, and thank the Prison for accepting the recovered material into their collection:

Olimpia Cullity, Curator

Eleanor Lambert, Assistant Curator

Bill Bowker, Property Manager

#### Introduction

On 1 September 2016, State Heritage archaeologist Dr Kelly Fleming was asked to assess archaeological material which had been encountered beneath the rear verandahs of the Warders' Cottages (7-17 Henderson St - W3) during conservation works to provide advice on the appropriate course of action. An inspection of the area was subsequently undertaken that afternoon.

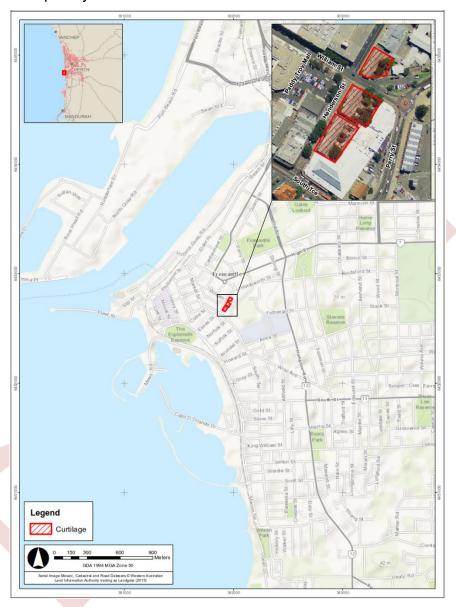

Figure 1 – Location map showing P877 Warders' Cottages

## Site Background

W3 was the third of three sets of cottages constructed in the mid-nineteenth century to house warders employed at the Fremantle Prison. The first group of cottages (W1) were constructed in 1851, with a second group (W2) constructed in 1852/53. In 1858 additional accommodation was required to house the warders resulting in the construction of W3. They served this purpose continuously until WWII.

A review of the Post Office Directories from 1929-1945, the period to which much of the salvaged material can be dated, indicates that occupants of the cottages often remained for 2-3 year periods with new warders moving in at intervals over time. In 1929 the cottages were occupied by Thomas Evans (No. 7), Robert Shannon (No. 9), Thomas Spurlang (No. 11), Sam McWhirter (No. 13), Alfred J Wyllie (No. 15) with No. 17 being listed as vacant. By 1930 Sam McWhirter had relocated to No. 17 with his former cottage (No. 13) being taken up by Felix Freitag. These occupants remain until 1933-34 when Thomas Evans, Robert Shannon and Alfred Wylie have moved on being replaced by Wilfred Mottram, Ernest Cant and G R Truslove.

Further movement occurred in 1935-36 with Truslove, Wylie and McWhirter being replaced by John Hall, Thomas Lee and Herbert Capes. 4 G White replaces Wilfred Mottram in 1936-37<sup>5</sup> and Reginald Pyatt replaces Herbert Capes in 1938-39.6 Thomas Lee, Ernest Cant and T Spurling moved on the following year with No. 9 now being occupied by M Monaghan, No. 11 by A Douglas, and No. 15 being recorded as vacant in 1939-40.7

In 1940-41 G White is replaced by C D Hamilton and G R Seeber takes up No. 15.8 These occupants remain until 1942-439 after which there is no entry for the cottages until 1945<sup>10</sup> when the occupants are no longer identified as warders. Sources suggest that from 1941 the warders were no longer required to reside at the cottages but that some continued to do so until 1991 when the Prison was closed. 11 However, given the occupations of the residents are not indicated, further research would be required to determine which of these may still be warders.

### Legislative Context & Listings

Warder's Cottages (HCWA Place No.877) has a high degree of cultural heritage significance demonstrated by its inclusion on the Local, State and National lists. Table 1 summarises the statutory protection afforded by these listings:

Table 1 – Summary of statutory listings affecting the Warder's Cottages site

## **Initial Site Inspection**

On arrival at W3 on 1 September 2016, a collection of material which had already been recovered from beneath the rear verandahs, and which had been moved to the mantelpiece of one of the cottages, was viewed and determined to date primarily to the inter-war period (c.1920-1940). The material largely comprised glass bottles with screw top openings, jars, cans, a teaspoon, and a collection of napkin rings. The contractor advised that these had been recovered from beneath the rear verandahs from a variety of locations.

The area beneath the rear verandahs was subsequently inspected and it was found to contain a large quantity of refuse (Figures 2 & 3) which appears to have been disposed of through holes that had opened up in the stone and brick wall built to block off the underside of the verandah at its southeast terminus. The wall is understood to have been constructed c.1900 but has deteriorated and been repaired in a haphazard fashion over time.

In addition, there was evidence to suggest that the sub-verandah area has been subjected to continual disturbance with a number of services (PVC and metal pipes) having been added at various intervals.

Figure 2 - P877 Warders' Cottages - rear verandahs W3 showing limestone and brick wall

Figure 3 – P877 Warders' Cottages – rear verandah showing example of material & infrastructure under floorboards

A visual inspection indicated that much of the in-situ material also dated to the interwar period (c.1920-1940). Included amongst it were ferrous cans which are likely to have contained food and kerosene or other chemicals/fuels, galvanised pots and buckets, bricks, glass bottles and jars, building materials, animal bone, limestone

rubble, glass and ceramic tableware, enamel kitchenware and miscellaneous other items (Figures 4-8).

Figure 4 – P877 Warders' Cottages – rear verandah showing example of material under floorboards, kerosene cans, pots, bricks and an aluminium can.

Figure 5 – P877 Warders' Cottages – rear verandah showing example of material under floorboards, including decorative glass fragment

Figure 6 – P877 Warders' Cottages – rear verandah showing example of material under floorboards, including enamel bowl and kerosene can

Figure 7 – P877 Warders' Cottages – rear verandah showing example of material under floorboards, including fencing wire and miscellaneous metal

Figure 8 – P877 Warders' Cottages – rear verandah showing example of material under floorboards, including galvanised bucket and pot

More recent material was also visible (Figures 9-10), as were the services which have been inserted in the latter part of the twentieth-century (Figure 3). Fragmentary asbestos was also visible, as were rolls of linoleum which are known to have often contained asbestos lining.

Figure 9 – P877 Warders' Cottages – rear verandah showing example of material under floorboards, including pot lid, fragmentary refuse, and coke can

Figure 10 – P877 Warders' Cottages – rear verandah showing example of material under floorboards, including terracotta flower pot, and c.1980 beer bottles

## Assessment of Archaeological Potential & Recommendation

The material was highly mixed and, due to the area having been subjected to multiple episodes of disturbance and intrusion, the archaeological integrity of the deposits was assessed overall as low. In addition, the relatively recent date of the majority of the material, and its random deposition, means the information it can provide with regard to research questions for the site and its occupants is also limited.

However, the archaeological context of some of the material was relatively intact i.e. the likelihood that it was deposited under the verandah by the cottages' occupants in the inter-war period was high, hence the recovery of samples for general information and interpretive purposes was recommended, with the remainder being removed and disposed of.

In addition, as the undisturbed deposits beneath the rubble/refuse layer may have been subject to a lower degree of disturbance, it was recommended that this layer be assessed once the overlying rubble/refuse layer had been removed.

#### **Significance**

The State Register of Heritage Places statement of significance for the Warders' Cottages is as follows:

the place is associated with the development of the Convict Establishment, in particular from the early 1850s, and the Fremantle Prison, a place of national significance, and, together with the Fremantle Court House and Police Station, defines the western boundary of this precinct;

the place has rarity value as one of the earliest examples of terrace housing and of purpose built public housing accommodation in the state;

the place has significant aesthetic value as competently designed and built twostorey terrace houses of limestone construction in the Victorian Georgian style;

the place is representative of the housing provided for public servants, in this case prison warders, in the nineteenth century and was modelled on workers' housing in England;

the place has associations with James Manning, Clerk of Works, and Captain Henderson, Royal Engineer and Comptroller General of Convicts; and,

the place is highly valued for its historical associations with Fremantle, in particular the Convict Establishment, and thus contributes to the community's sense of place.

The above indicates that the primary significance of the place relates to its convict era associations. Material dating to the mid twentieth-century, although still having a degree of significance for its ability to provide information about the lifeways of the Warders' into this later period, is of secondary significance to era dating to the convict period.

## **Research Questions**

As noted, the potential for the refuse/rubble layer to answer substantive research questions is relatively low. However, the material has some degree of archaeological significance and the following research questions may be addressed by some further investigation:

- What were the disposal practices of the cottage occupants, and what was the primary period this practice occurred?
- What does an examination of the artefacts tell us about the consumption patterns of the occupants?
- What can the refuse/rubble layer, and its overall deposition, tell us about the construction activities at the site over time?

With regard to the deposits beneath the current rubble/refuse layer, should it remain undisturbed, the following research questions may be addressed:

- What were the material conditions of the cottage occupants through time, and in particular the Warders?
- What can the archaeology of the place tell us about how the occupants lived e.g. what they ate/drank, what they owned, what they wore etc through time?
- What can the archaeology of the place tell us about the social and economic conditions of the occupants through time?
- Are there indications that they were maintaining activities tied to their social identity in England?
- What does the archaeology tell us about the activities occurring at this location within the domestic space?
- If compared to deposits/excavated material from elsewhere, does the archaeology of the cottages provide an insight into the austerity of the Warders lives, and is this consistent with other 'working class' assemblages in Western Australia at this time?

The above are general research questions that may be addressed through an archaeological investigation of undisturbed deposits across the whole of the warders' cottages site.

## Interpretation

Although the archaeological significance of the refuse/rubble layer is relatively low, the interpretive potential of some of the material may still be moderate to high. Due to the direct connection of the Warders' Cottages to the Fremantle Prison, material recovered dating to the period in which the cottages were occupied by Prison staff may provide some insight into their behaviour, material culture and living conditions.

Items recovered for interpretive purposes may include those that can be specifically associated with a time period, individual, or activity, or those that may be 'ornamental' or ornate. In addition, a sample of bottles that represent the time period in which the refuse/rubble layer was deposited and can demonstrate consumption, product choice, or the way of life at that time may allow for an interpretation of living conditions and lifestyle.

## **Recording and Recovery**

Due to the highly disturbed nature of the refuse deposit, and the relatively recent date of the material and its deposition, the following was recommended for recording and recovery:

- Suitably qualified and experienced historical archaeologists should work through the rubble/refuse layer systematically to record any items that may be used to address the above research questions. However, given the limited research potential of the site this should be a general characterisation and photographic record as opposed to a large-scale recovery. Some artefact samples may be recovered if deemed appropriate.
- During this process the archaeologists should recover any items that may be used in an interpretive capacity in consultation with Fremantle Prison collections staff.
- Any material recovered for either its archaeological research or interpretive potential, should be assessed and accessioned into the Fremantle Prison collection.
- The remaining material can then be removed and disposed of.

However, the asbestos contamination present in the refuse layer resulted in the contractors advising State Heritage staff they could not access the area. Instead, labourers were provided who were supervised by State Heritage.

With regard to the layer underlying the refuse/rubble layer, the following was recommended:

- Once the refuse/rubble layer has been removed, a suitably qualified and experienced historical archaeologist should assess the exposed ground level to determine its integrity and archaeological potential. Unnecessary ground disturbance should be avoided.
- However, should ground disturbance be unavoidable, this should be recovered via controlled archaeological excavation or, if this is not possible due to the contamination, monitored by an appropriately qualified historical archaeologist with the deposits recorded and recovered.

Once the overlying refuse was removed it became apparent that the underlying layer was also highly disturbed so a similar process was utilised to recover samples from this layer with the remainder being disposed of.

Whilst the archaeological monitoring process was underway the contractors also advised a series of five trenches adjacent to the original rear steps (Figures 12 & 13) would need to be excavated for the construction of firewalls which would result in the disturbance of what may be in-situ archaeological deposits from the early occupation period. Due to the contamination issues, officers were again unable to participate so it was recommended that the excavation of these be undertaken in a controlled manner with hand shovels, and be monitored by SHO archaeologists.

Figure 11 – View of rear verandahs showing location of some of the original rear steps

Figure 12 – Locations of the five firewall trenches

## **Site Visit/Methods**

On Thursday 8 and Friday 9 September 2016, historical archaeologists from State Heritage attended the site and supervised the recording and recovery of the refuse layer beneath the rear verandahs of W3. The excavation of the five firewall trenches (Figure 12) was also monitored.

The labourers provided by the contractor were outfitted in PPE and given a quick briefing as to the process to be followed by SHO before entering the area under the rear verandah. Historical archaeologists Kelly Fleming and Karina Williams (Thursday) and Kelly Fleming and Daniel Holland (Friday) monitored the removal of the refuse layer (Figure 13) as the contractor's labourers moved from the northeast end (Unit 17) to the southwest end (Unit 7; Figure 14).

Figure 13 – W3 Unit 17 Showing contractors recovering material

Figure 14 – Map showing cottage and quadrant designations

Material removed by the recovery team was briefly inspected then relocated to the area southeast of the stone wall blocking off the verandah and inspected more closely by SHO archaeologists. Items were sorted into material type and photographed.

The material recovered ranged from intact clothing items, ferrous metal cans both food and fuel, glass bottles many of which were intact, ceramic tableware, children's toys and other miscellaneous items (a brief catalogue is provided at Appendix 1).

The following photographs (Figures 15-26) provide an overview of the material. A full set of photographs are provided at Appendix 2. The refuse layer was the densest at Unit 13, whereas Unit 17 had very little, the majority of which was post 1960s.

Figure 15 – W3 Unit 15 NE side NE of stairs, ferrous metal artefacts

### **Results**

#### Refuse Layer

The recording and recovery of material from beneath the rear verandahs at W3 revealed some general information about the material conditions of the occupants. However, the highly-mixed nature of the assemblage rendered its research value relatively low. Although the material could be linked to the cottage from which it came, and the approximate location of its disposal, the continual disturbance of the sub-verandah area makes a more definitive identification of its archaeological context tenuous. In addition, although the approximate manufacturing date of some of the material can be determined, without an archaeological context its specific period of use and/or disposal cannot be determined.

Overall the material can be described as general household refuse with a fairly standard array of material objects that would have been commonly purchased/used by working class families in the inter-war period. As noted the conclusions that can be drawn are fairly limited, but the following provides a brief analysis of the assemblage at each cottage.

#### Cottage 17

Cottage 17 is located at the northernmost end of the row of cottages, directly adjacent to the laneway which runs through to the Fremantle Markets. Material at this location was limited and primarily comprised building rubble and late twentieth century refuse. This may indicate that the occupants had cleaned the sub-verandah space over time, did not dispose of refuse in this space as the other cottage occupants did, or that the area remained inaccessible until the more recent past.

Alternatively, the lack of general refuse and absence of children's or women's items may suggest that the cottage was occupied by a single male.

#### Cottage 15

Cottage 15 is located southwest of Cottage 17. Material at this location comprised ferrous food cans, fuel cans, as well as toys, ceramics, bone and alcohol and food bottles. The material was consistent with general household refuse from working class assemblages i.e. relatively inexpensive and mass produced, and most items for which a date could be determined were c.1920-40. The presence of toys would suggest one or more children were in residence.

#### Cottage 13

Cottage 13 is located southwest of Cottage 15 and comprised the densest assemblage of the cottages. This was again consistent with general domestic refuse dating to the c.1920-40 period, and included ferrous food cans, fuel cans, toys, ceramics, and alcohol, food and medicine bottles. A number of bone fragments was also recorded at Cottage 13, as was the front door section of a Metters Stove. A higher proportion of 'industrial' items to the other cottages was recorded here also, including car parts, and miscellaneous iron objects.

Bottles included beer, case gin, condiments, and laxatives, whilst a number of the food cans were consistent with the short squat 'Bully Beef' type cans. Bone, although not analysed in detail, was from mainly sheep with some cow bone. Women's and children's items were also recorded here albeit not in as high numbers as at Cottage 15.

#### Cottage 11

Cottage 11 is located southwest of Cottage 13 and, similar to its northeast neighbour, comprised a fairly dense assemblage consistent with general domestic refuse dating to the c.1920-40 period. At Cottage 11 this included ferrous food, fuel and paint cans, cooking implements, bed and bicycle parts, writing slate fragments, women's and children's shoes, ceramics, and alcohol, food and medicine bottles.

Alcohol bottles included mainly beer with some sprits, with other glass vessels having contained condiments and medicines or poisons. Food cans were various with some fish cans present. Bone was mainly sheep, and what appears to be a small dog skull. The assemblage from Cottage 11 again included a number of 'industrial' items e.g. car parts. One fuel can had holes in its sides indicating it was probably converted for use as a bucket.

#### Cottage 9

Cottage 9 is located southwest of Cottage 11. The assemblage here was not as dense as at Cottages 11 & 13, but did comprise some comparable material including ferrous food, fuel and paint cans, cooking implements, bone, bed and bicycle parts, ceramics, and alcohol, food and medicine bottles.

Bottles comprised beer and spirits as well as vinegar, floor polish, ammonia, and cold medicine. Food cans were various including 'Bully Beef' style, milk, and fish, though many were consistent with the dimensions of fruit or vegetable cans. Bone comprised largely sheep with some cow. Amongst the ceramic assemblage was a

large white chamber pot or possibly a tureen, and a plate, shallow bowl, mixing bowl and cup. Some notable 'industrial' items were recorded here too with what appeared to be a pith-type helmet and a heavy leather or canvas apron, perhaps indicating the occupant was engaged in welding, iron work or other industrial activities. As for Cottage 11 one fuel can had been converted into a bucket. Women's and children's items were not as common here as at Cottage 15, though two large baby formula cans were recorded. The assemblage again largely represents general domestic refuse dating to the c.1920-40 period.

## Cottage 7

Cottage 7 is located southwest of Cottage 9 and comprised the smallest assemblage overall. The glass bottles here were largely medicinal, albeit with some spirits, beer and condiments. Two shoes, one a woman's and the other a child's, and a cosmetic case were also present. Ceramics comprised a whiteware plate with gilded banding, with children's toys, buttons and a stoneware ornament also amongst the assemblage. Ferrous cans were limited with only two food, one paint, and two fuel cans.

#### General Observations - Refuse Layer

As noted above the assemblages were largely consistent with domestic refuse dating to the c.1920-1940 period. Food cans and glass bottles indicate a variety of consumption practices, with the presence of bone also indicating access to fresh meat. The fairly high proportion of alcohol vessels suggests the most common beverage was beer, whilst the presence of quite a number of medicinal bottles, including laxatives, may indicate the occupants were using home remedies to treat various ailments with the laxatives perhaps suggesting a poor diet.

Most of the assemblages at the cottages comprised evidence for the presence of both women and children, whilst what were most likely male activities during this period were represented by industrial items. The quality and type of items present would be consistent with a working-class assemblage during this period i.e. relatively inexpensive ceramics, a low number of highly decorative or high quality objects, easily affordable and accessible canned products, and a higher proportion of bone representing lamb/mutton as opposed to beef.

#### Firewall Trenches

As noted five trenches were excavated (Figure 12) by the labourers provided by the contractor monitored by SHO archaeologists. Trenches 1 & 2 (at the northern end) contained little or no material and appeared to be quite disturbed deposits. However, trenches 3, 4 & 5 comprised less disturbed deposits with a small number of artefacts in-situ.

#### Firewall Trench 3

Trench 3 was situated directly adjacent (NE) to the original rear steps for Unit 13, with the rear yard of Unit 11. The uppermost layers were mixed with amber bottle glass fragments found just below the original bottom step. As the trench was excavated further a small whiteware bowl fragment was recovered and in the layer beneath this was a glass perfume bottle (approx. 1150mm below the bottom step)

and transfer-printed earthenware fragments (approx. 1250mm below the bottom step; Figure 27).

Figure 27 - Firewall trench 3, final excavation depth

### Firewall Trench 4

Trench 4 was situated directly adjacent (NE) to the original rear steps for Unit 11, with the rear yard of Unit 9. The top layers were again mixed, with a butter knife being recovered just below the original bottom step. As the trench was excavated little material was encountered until at approximately 1280mm below the bottom step (Figure 28) a clay pipe bowl was recovered which was inscribed 'BEN NEVIS'.

Figure 28 - Firewall trench 4, final excavation depth

#### Firewall Trench 5

Trench 5 was situated directly adjacent (NE) to the original rear steps for Unit 9, with the rear yard of Unit 7. The top layers were again mixed, with metal fragments and amber bottle glass recovered just below the original bottom step. At approximately 1220mm below the top step (Figure 29) a mixture of transfer-printed earthenware tableware was recovered along with an olive bottle glass fragment.

Figure 29 - Firewall trench 5, final excavation depth

## General Observations – Firewall Trenches

The material recovered from firewall trenches 3, 4 & 5 would indicate that the lower levels may represent in-situ deposits possibly dating to quite early in the occupation of the cottages. The BEN NEVIS clay pipe, and fragments of transfer-printed earthenware would be consistent with a c.1880-1910 occupation date, whilst their position, at the base of deposits directly adjacent to the original rear steps, would also be consistent with items common to 'sweep zones', or areas outside the home where material swept out the back door, such as fragments of broken tableware,

may end up. Some further analysis of these artefacts and their manufacturing period may provide further information.

#### **Conclusions & Recommendations**

The recording and recovery of refuse situated beneath the verandahs at W3 resulted in a rich collection of artefacts dating mainly to the inter-war period. Although recovered using a salvage methodology due to both contamination issues and indications that the deposit was highly disturbed, the resulting collection will still provide quite a rich source of information about the occupants at this time. Further analysis undertaken by the Fremantle Prison curatorial team will provide additional information about the material and its contribution to the story of the cottages' occupants. In addition, the high degree of preservation of the material recovered will enable much of it to be accessioned into the Fremantle Prison museum collection (Appendix 3) allowing it to be included in interpretation that communicates the story of the lives of the warders.

With regard to the artefacts recovered from the lower level of the firewall trenches, these appear to be in-situ deposits dating to the early occupation of the cottages. Should further ground disturbance be proposed for these areas, recovery via controlled archaeological excavation, by suitably qualified and experienced historical archaeologists, is recommended.
